

FROM GAPS TO COMPLIANCE: MLR TRIBAL'S SECURITY TRANSFORMATION WITH VIYU

CHALLENGE

MLR Tribal Solutions needed to enhance endpoint security and improve HIPAA compliance requirements across all workstations. The team faced inconsistent encryption rollout and lacked automation around security event response and device tracking.

- Existing antivirus solution lacked MDR capabilities
- Some devices failed to prompt users for drive encryption, causing delays
- No centralized system for managing encryption, updates, or lost/stolen device tracking

SOLUTION

Viyu implemented the aResta managed services package, including Sophos MDR, full workstation encryption, and policy updates to meet HIPAA standards. Additional tools like Intune and Cavelo were introduced for device control and vulnerability scanning.

- Upgraded from Intercept X to Sophos MDR with 365-day log retention and centralized encryption policies
- Troubleshoot and resolved encryption errors using WMI and BitLocker repair tools
- Introduced Intune for device tracking and Cavelo for annual vulnerability scanning as part of HIPAA compliance strategy

OUTCOME

MLR Tribal's devices are now fully encrypted, monitored 24/7 through MDR, and exceed current HIPAA requirements, including secure logging, vulnerability management, and remote wipe capability.

- Confirmed successful encryption across all target devices via Sophos Portal
- Ongoing threat monitoring and remediation now handled automatically via MDR
- Foundation established for secure, scalable policy deployment with Intune and Cavelo
